Wellcomtrol* Quality Control Sera

Quality control in clinical chemistry has become a vital requirement in today’s laboratories. This control needs to cover the precise performance of a given technique, the reagents and the instruments used, both in detecting rapidly any insidious lack of reproducibility and identifying it.

Wellcomtrol Quality Control Sera offer the means of ensuring this total requirement with Wellcomtrol Unassayed, the most economical daily check of reproducibility. Rapid, reliable and especially suitable for automated procedures.

And when lack of reproducibility is revealed, a definitive estimation of the degree of deviation is provided with Wellcomtrol Assayed which gives accurate figures for more than 30 constituents, including iron binding capacity, iron and other routinely measured inorganic substances, drugs, hormones and many enzymes.

For complete quality control Wellcomtrol Assayed may be used at regular intervals, say weekly, in conjunction with the daily use of Wellcomtrol Unassayed.

This new Unicam UV Spectrophotometer has been made to meet your requirements

To meet, in fact, the requirements of every UV spectroscopist—whether engaged in research or in routine applications. And that means that the new Unicam SP8000 Ultraviolet and Visible Recording Spectrophotometer is just about the most versatile instrument available. To start with you get superb presentation and reproducibility of spectra on the integral flat-bed recorder. You get dual absorbance scales of 0-1.0A and 0-0.2A with back-off. You get exceptional scale expansion. There is a large sample compartment and a unique second sample position. There is a whole range of modular accessories for automation. If you want digital print out, results in concentration units, automatic wavelength selection, programme control, automatic sample changing of up to 50 samples—you name it and the likelihood is that the Unicam SP8000 system can do it. The Unicam SP8000 is the latest addition to an outstanding range of UV instruments which includes the SP500 Series 2, the SP700, the SP800 and the award-winning SP3000. To learn more about any of these write to us today.

NEW BOOKS FROM BLACKWELL

The Megaloblastic Anaemias

Although two short monographs on the megaloblastic anaemias appeared in the 1950s, there is no detailed account of these disorders of haemopoiesis embracing the haematological and biochemical as well as clinical aspects. This book sets out to fill this gap and it presents a detailed and critical account of knowledge in this field covering haematology, biochemistry and physiology of B12 and folic acid, laboratory and clinical investigations, pathological physiology in the megaloblastic anaemias, the haematological response and a full account of the clinical disorders which are associated with megaloblastic haemopoiesis.

Respiratory Diseases

This book is written primarily for graduates with a particular interest in chest diseases and as a reference book for those faced with a problem in this field. It attempts to approach the subject with a broad interest, not only paying attention to the clinical aspects of respiratory disease but also giving full weight to epidemiology and to functional abnormality as revealed by physiological testing. There is a lengthy introductory section on respiratory anatomy and physiology and also chapters on some of the general aspects of epidemiology and of chemotherapy, as well as thorough treatment of individual diseases and full references to the literature. There is also a chapter on the diagnostic approach to common clinical problems of chest diseases.

Tetanus

Although the authors have all been actively engaged in research work on various problems related to tetanus, this book has been written specifically for the practising doctor. It outlines what is known about the organism, the disease process and the epidemiology of tetanus. Prevention is discussed more fully, with practical advice about measures which should be taken for effective immunization. The clinical features are described, the causes of death discussed, and various prognostic criteria evaluated. Conservative treatment (using drugs to reduce rigidity and control spasms) and the total paralysis regimen (with curare and intermittent positive-pressure respiration) are compared and described in some detail, with practical advice regarding the management of patients which is based on the experience of one of the authors.

Infectious Mononucleosis

It is increasingly recognised that infectious mononucleosis can no longer be dismissed as a trivial condition whose main interest lies in the circumstances under which it may be acquired. The application of modern techniques of investigation emphasises that the disease is remarkable, not only in its own right but also as a model for studying other lymphoproliferative disorders such as acute leukaemia. A re-appraisal of the clinical and experimental features has long been overdue and this book covers a large range of the main aspects of the disease. It will be of interest to a wide variety of readers, particularly clinicians, pathologists, virologists and immunologists.

Clinical Rheumatology

This book provides for physicians a simple, concise and comprehensive account of the rheumatic diseases. It aims to describe some of the scientific background to the subject and to give an account of more recent developments in research in this field. Each chapter is accompanied by a list of approximately 150 references to allow the reader to explore further any part of the subject which particularly interests him.

New Books from Blackwell

Methods in Toxicology

Methods in Toxicology deals with the various laboratory techniques used to assess the probable safety of chemical agents when man and other non-laboratory species are exposed to them in conditions of use. Each chapter deals with a different aspect of the laboratory studies to toxicity and is written by an acknowledged expert in the particular field. Toxicology is not a self-contained discipline with its own techniques, but draws on the techniques of many disciplines. Consequently most units that deal with studies of toxicity must draw on the knowledge and experience of others. This book is intended to draw together accounts of the best methods available at the present time, and to give the benefit of the experience of those who have used, and in many cases actually developed these methods, to those intending to use them in their own laboratory.

The Differential Diagnosis of Fibroblastic Disorders

This monograph deals with tumours and tumorous conditions involving the proliferation of fibroblasts or cells such as histiocytes capable of behaving as facultative fibroblasts. There are four main sections dealing respectively with inflammatory and reactive lesions; the fibromatoses; benign tumours and lastly, malignant tumours. Particular emphasis is laid on the importance of relating histology to behaviour and of distinguishing true neoplasms from the pseudo-neoplastic conditions. It is designed as a handbook for the practising histopathologist and includes a bibliography with each chapter for those wishing to study any given condition in greater depth. Brief comments on treatment are also given as the monograph is intended for surgeons and radiotherapists as well as pathologists.

Management and Treatment of Tropical Diseases

For the compilation of this new book the editors have assembled a team of contributors, each an expert in a specific area of tropical disease. Part 1 contains chapters devoted to the various different tropical diseases and is arranged geographically as far as possible. Part 2 contains details of drugs arranged alphabetically including chemical and pharmacological information, dosage requirements, side effects and toxicity. For each disease the authors cover all relevant aspects of management including nursing, individual hygiene, public health and environmental aspects, physiological adjustments including transfusion and fluid replacement and any other relevant manoeuvres. Drug treatment is described in detail.

Clinical Haematology in Medical Practice

In preparing a new edition of this well-known and excellent book the author has made a complete revision of the text; it is now 61 pages longer. Professor de Gruchy's presentation of clinical haematology, with his sound common-sense approach to the use of tests and interpretation of results, is a pleasure to read....The author is to be congratulated on maintaining the high standard he has set himself in producing this first-class work on blood disorders, which all who are interested in haematology will want to possess.* The Practitioner (on the second edition).

An Important New Book from Blackwell—

An Introduction to Metabolic Pathways

S. Dagley M.A. D.SC. F.R.I.C.
Professor of Biochemistry, University of Minnesota

Donald E. Nicholson B.SC. PH.D. F.I.BIOL. F.R.I.C.
Senior Lecturer in Bacteriology, School of Medicine, University of Leeds

This book is based on Dr. Nicholson's Metabolic Pathways Chart which is extensively used in biological laboratories throughout the world. About half the book is concerned with the ideas and methods involved in the determination of metabolic pathways, and the ways in which they are controlled—ultimately on the genetic level. The other half examines, in a rather unconventional way, some of the more important pathways of metabolism. These pathways are arranged in vertical sequence with relevant enzymes, co-factors and references inserted between each reaction. It should be a useful introduction to this rapidly growing field for the uninitiated student and for the research worker.

1970. 356 pages, fully illustrated. 75s.
